

AWS Facilitated Event Setup

If you are attending an AWS-hosted workshop, most of the heavy lifting has already been done. We just need to set up Python and confirm your AWS access works.

Step 1: Access Your VS Code Online IDE

1. Find your VS Code URL in the workshop landing page provided by your facilitator
2. Open the URL in your browser

✓ Copied!

oscarrodriguezwork ▼

You should now see a VS Code interface with a terminal at the bottom.

Step 2: Set Up Your Python Environment

In your VS Code terminal, run these commands:

```
1  # Create a new directory for our workshop
2  mkdir agentic-ai-workshop
3  cd agentic-ai-workshop
4
5  # Create a Python virtual environment
6  python -m venv .venv
7
8  # Activate the virtual environment
9  source .venv/bin/activate
10
11 # You should see (.venv) in your terminal prompt now
```

Step 3: Install Dependencies

Create a requirements file and install packages:

```
1 # Create requirements.txt file
2 cat > requirements.txt << EOF
3 boto3>=1.34.0
4 streamlit>=1.28.0
5 requests>=2.31.0
6 Pillow>=10.0.0
7 EOF
8
9 # Install all dependencies
10 pip install -r requirements.txt
```

This will take a minute or two to download and install all the packages.

Step 4: Verify Your Setup

✓ Copied!

Test that everything is working:

```
1 # Test Python and boto3
2 python -c "import boto3; print('✓ boto3 installed successfully')"
3
4 # Test Streamlit
5 python -c "import streamlit; print('✓ Streamlit installed successfully')"
6
7 # Test AWS credentials (should show your account info)
8 aws sts get-caller-identity
```

You should see output showing your AWS account details. If you get an error, ask your workshop facilitator for help.

Troubleshooting

"AWS credentials not found"

- Ask your workshop facilitator - credentials should be pre-configured

Virtual environment issues

In your VS Code terminal, run these commands:

```
1 # If activation fails, try:
2 python -m venv --clear .venv
3 source .venv/bin/activate
```

Package installation fails

In your VS Code terminal, run these commands:

```
1 # Try upgrading pip first
2 pip install --upgrade pip
3 pip install -r requirements.txt
```

Setup Complete

✓ Copied!

You should now have:

- VS Code Online IDE running
- Python virtual environment activated (you'll see `(.venv)` in your prompt)
- All required packages installed
- AWS credentials configured and tested
- Claude 4.5 Sonnet access enabled (this is on by default in an AWS-facilitated event)
- A working directory called `agentic-ai-workshop`

Your environment is ready. Next we'll look at how the agent's architecture fits together.

Next: Understanding the Architecture
